Convolutional Networks

Motivation, working with images, trainable kernels

Machine Learning and Data Mining, 2020

Artem Maevskiy

National Research University Higher School of Economics

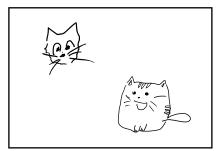

How to work with image-like data?

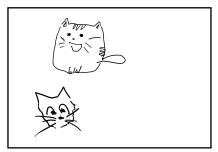

Working with images

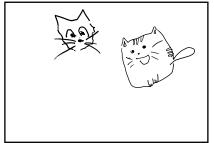

- Extreemly high-dimensional input
 - E.g. even a small 640x480 color image would make up almost 1M input features (pixel brightness levels in R, G and B)
 - So a fully-connected hidden representation with just 100 units would require 100M parameters

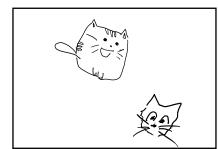

Working with images

- Extreemly high-dimensional input
 - E.g. even a small 640x480 color image would make up almost 1M input features (pixel brightness levels in R, G and B)
 - So a fully-connected hidden representation with just 100 units would require 100M parameters
- Is quite data-hungry to train when using fullyconnected layers:
 - Identifying an object on a picture would require examples with all possible locations of that object on the picture

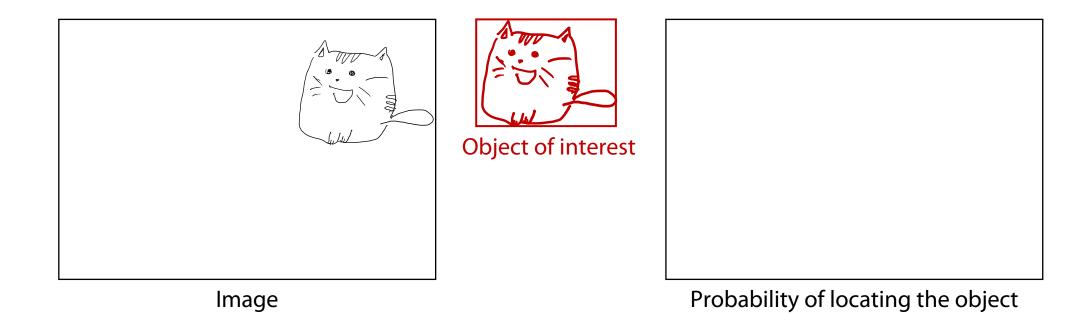

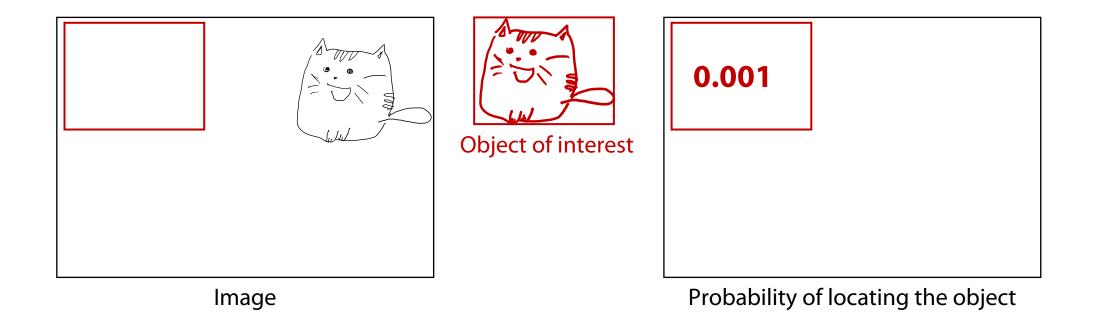

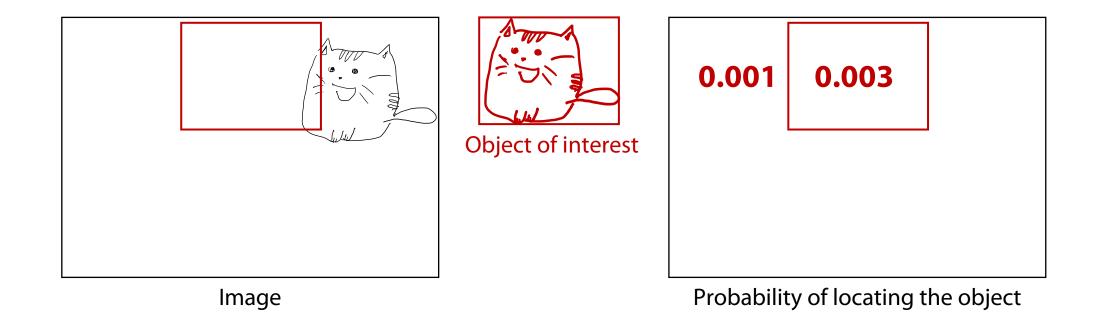

- ► A cat moved from one part of an image to another is still a cat
- Why don't we use the same model to look at different patches of an image trying to identify the object of interest:

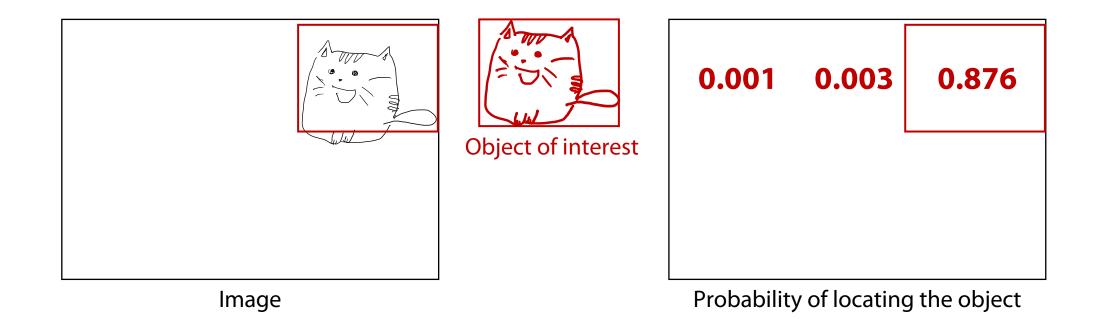

- ► A cat moved from one part of an image to another is still a cat

This may be implemented with a 2D convolution!

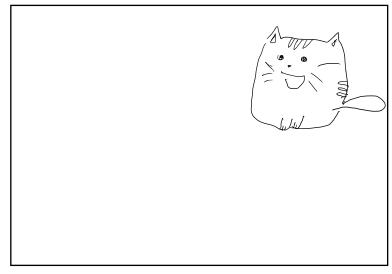

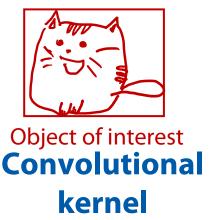

Image Input

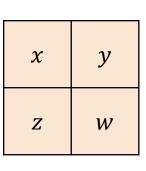

Probability of locating the object **Output**

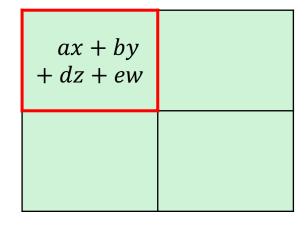

Output
$$(i,j) = \sum_{i',j'} \text{Input}(i',j') \cdot \text{Kernel}(i'-i,j'-j)$$

а	b	С
d	e	f
g	h	i

Input

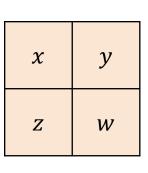

Kernel

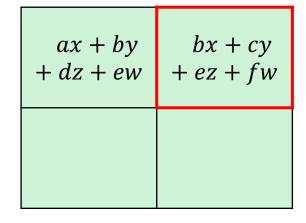

Output
$$(i,j) = \sum_{i',j'} \text{Input}(i',j') \cdot \text{Kernel}(i'-i,j'-j)$$

а	b	С
d	e	f
g	h	i

ax + by + dz + ew	bx + cy + ez + fw
dx + ey + gz + hw	ex + fy + hz + iw

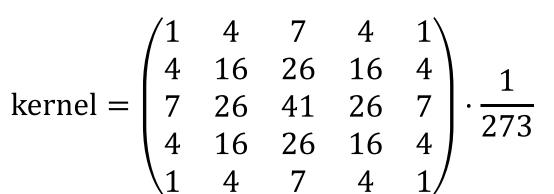

Input

Output

Different kernels may extract different features

Ouput

Input

► Sharpen:

$$kernel = \begin{pmatrix} 0 & -1 & 0 \\ -1 & 5 & -1 \\ 0 & -1 & 0 \end{pmatrix}$$

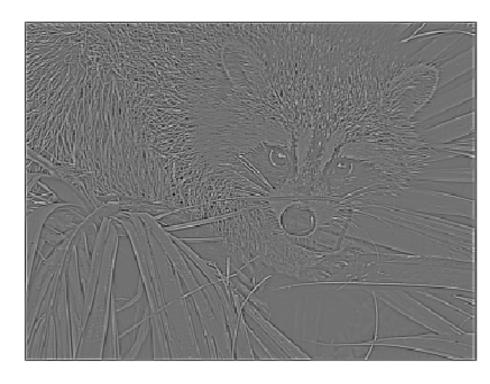

Ouput

Input

► Edge detection:

$$kernel = \begin{pmatrix} -1 & -1 & -1 \\ -1 & 8 & -1 \\ -1 & -1 & -1 \end{pmatrix}$$

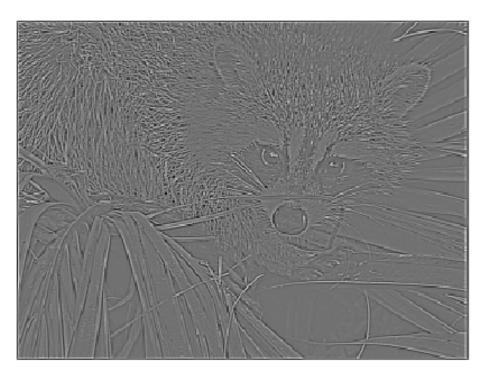

Ouput

Input

Edge detection:

$$kernel = \begin{pmatrix} -1 & -1 & -1 \\ -1 & 8 & -1 \\ -1 & -1 & -1 \end{pmatrix}$$

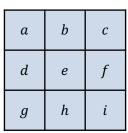

Ouput

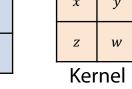

- In the context of deep learning, the kernel parameters are trainable
- I.e. the network learns the kernel to extract useful features

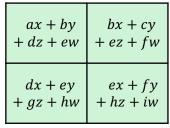

2D convolution as a matrix multiplication

- Unwrap the 2D images into 1D vectors
- Re-write the convolution as a regular matrix-vector multiplication

- I.e. fully-connected layers comprise convolutions
 - Yet they are much more complex

Input

Output

ax + by + dz + ew
dx + ey + gz + hw
bx + cy + ez + fw
ex + fy + hz + iw

x	у	0	Z	W	0	0	0	0

2D convolutional layers

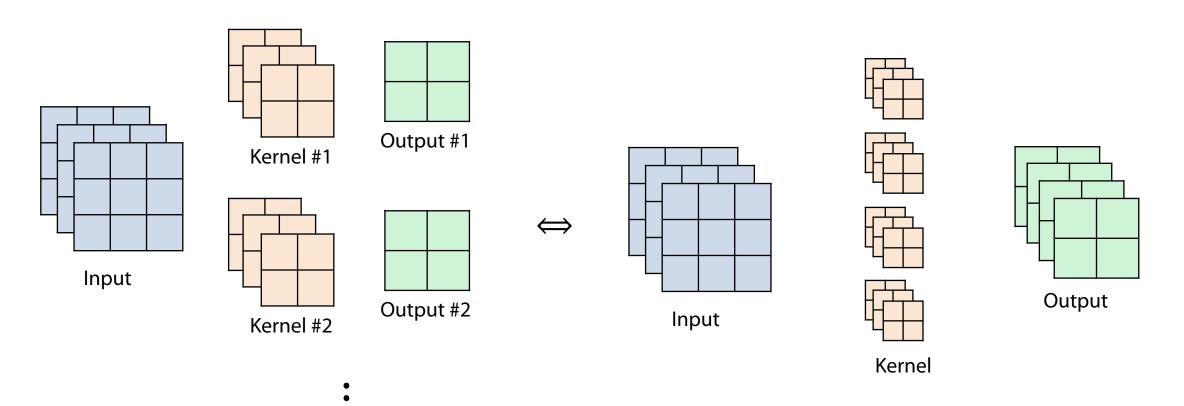

Input channels

- ► In practice images have multiple channels
 - E.g. 3 color channels of a color image

Output channels

► In practice we want to extract multiple features

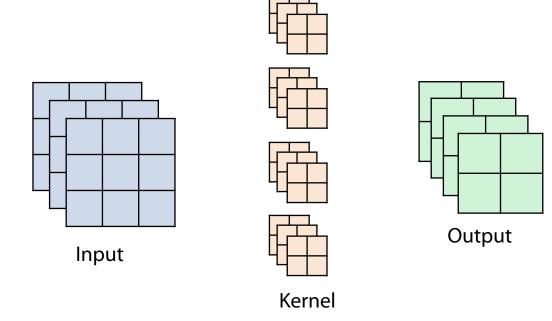

- Kernel becomes 4D: $H_K \times W_K \times C_{in} \times C_{out}$
- ▶ Output becomes 3D: $H \times W \times C_{out}$

Putting it all together

bias term

$$Output(i, j, c_{out}) = \sum_{i', j', c_{in}} Input(i', j', c_{in}) \cdot Kernel(i' - i, j' - j, c_{in}, c_{out}) + b_{out}$$

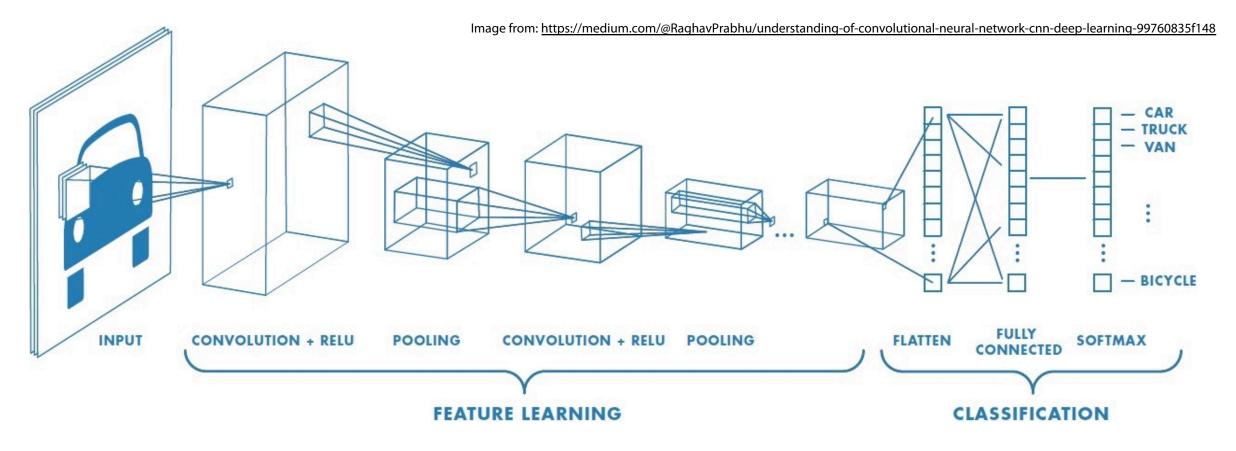

- Note: with this approach the output width/height is smaller than the input width/height
 - By how much (for a given kernel width and hight)?
- Sometimes the border of the input image is padded with some values (e.g. s.t. the output has the same size)
 - Controlled by the "padding" parameter

- Some other parameters:
 - "stride" by how many pixels the kernel window steps (equals 1 in the examples here)
 - "dilation" kernel "spread" (e.g. see this animation)

Typical network architecture

Deep convolutional network

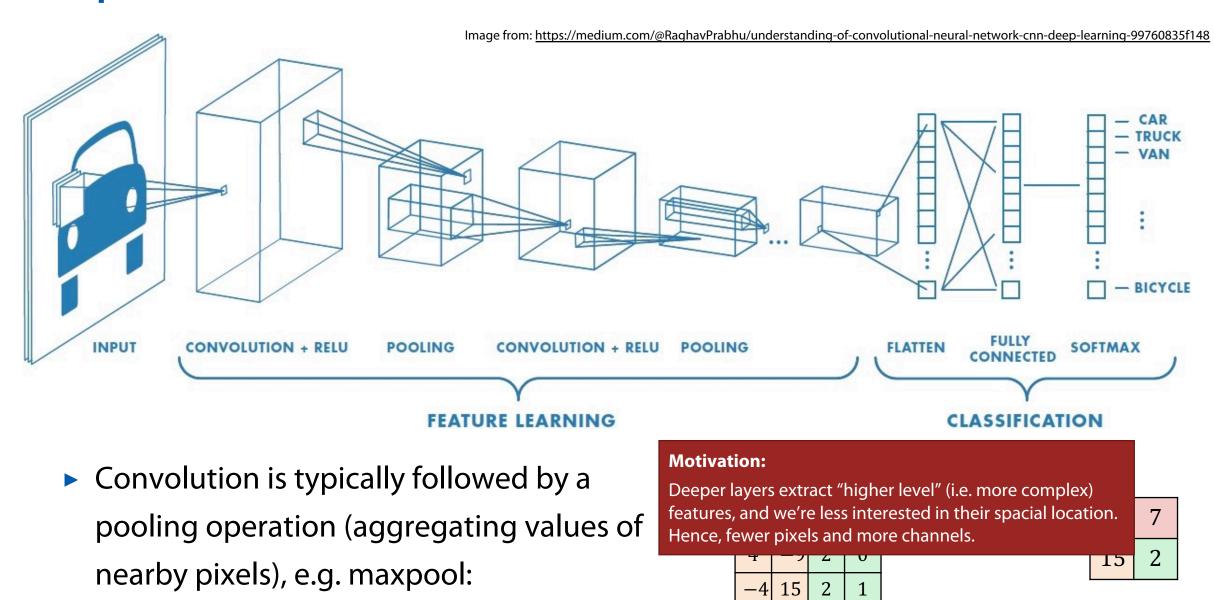

Convolution is typically followed by a pooling operation (aggregating values of nearby pixels), e.g. maxpool:

1	-2	5	7
2	1	4	-3
4	-9	2	0
-4	15	2	1

 $\xrightarrow{\text{maxpool}(2\times2)} \begin{array}{c|c} 2 & 7 \\ \hline 15 & 2 \end{array}$

Deep convolutional network

Thank you!
